

Method-dependent Bar Fraction in the Local ($z \sim 0.01$) Universe

Lee, Yun Hee (KNU), Ann, Hong Bae (PNU) & Park, Myeong-Gu (KNU)

- Algorithm for data reduction and image analysis
- Cautions for automatic bar classification
- A new method for bar classification using ellipticity augmented by bar strength ratio map
- Method-dependent bar fraction on Hubble-sequence/color
- Luminosity/mass-dependent bar fraction

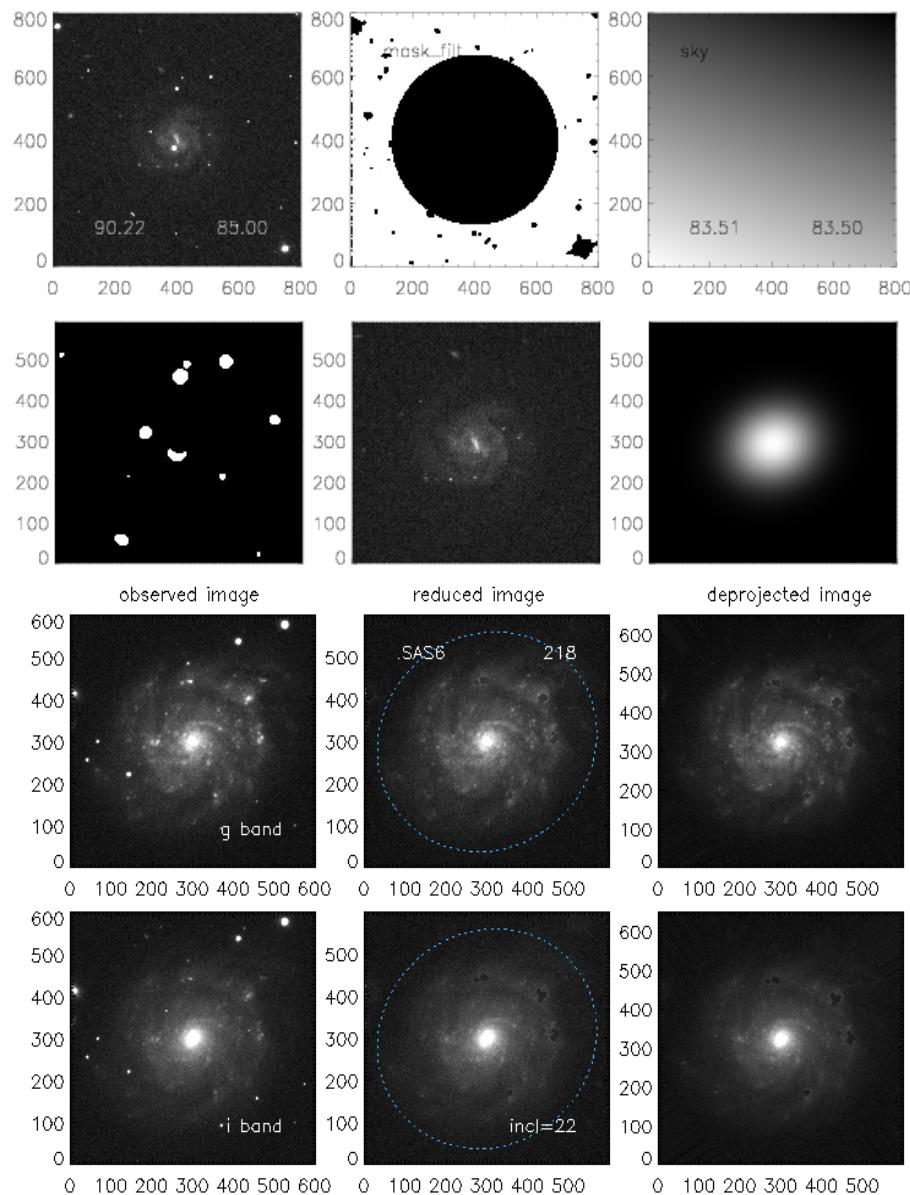

1. Introduction: Observation

- ~60% of spirals (SB 30% + SAB 30%)
- Related to AGN, central SF, pseudo-bulge, ring, internal secular evolution and so on
- **Hubble type /Mass/Color-dependent Bar Fraction**
 - Early spirals : Sheth et al. 2008, 2013,
Lee et al. 2011,
Galaxy zoo project
 - Late spirals : Marinova et al. 2007,
Barazza et al. 2008, 2009,
Aguerri et al. 2009
 - Bimodal : Nair et al. 2010

1. Introduction: Simulation

- Always formed quickly when they have a **massive**, dynamically cold and **rotationally supported disk** in isolate system (Hohl 1971; Ostriker & Peebles 1973)
- Dominant **dark matter halo** plays a role in delaying bar formation initially, but ultimately makes bars be stronger than in non-DM-dominated galaxies (Athanassoula 2002)

2. Sample & Reduction

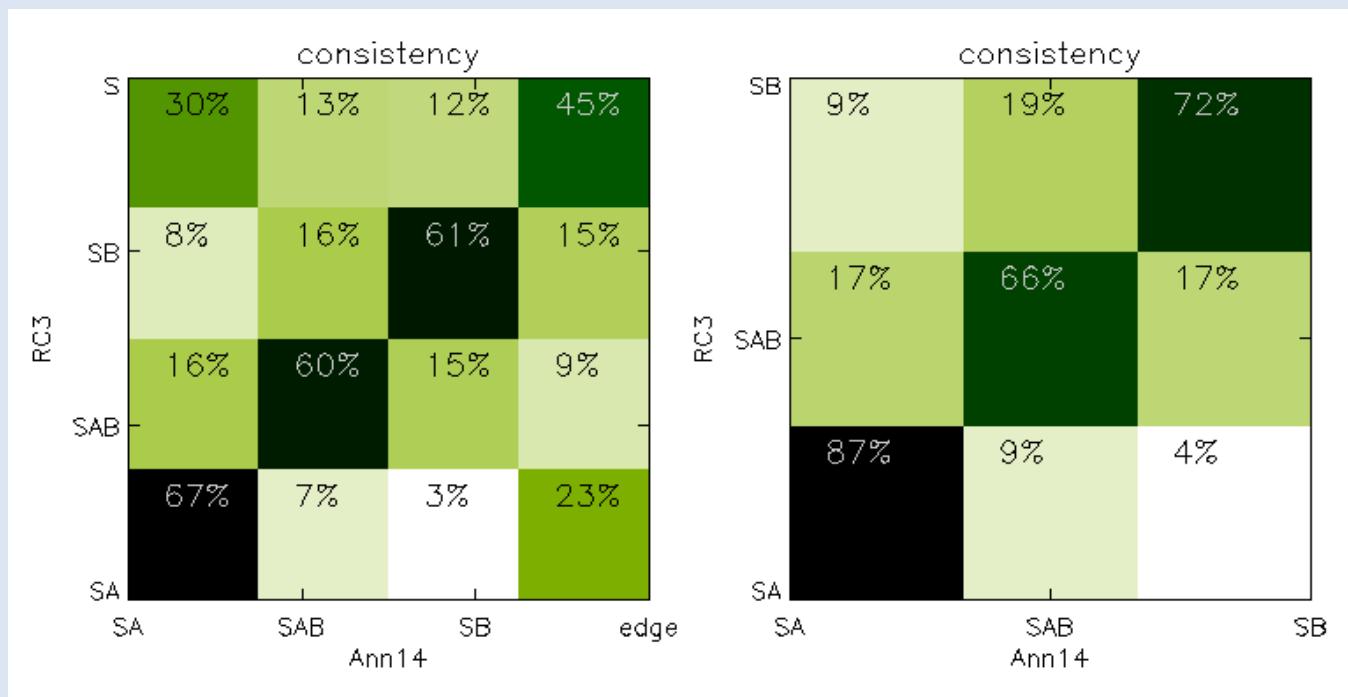

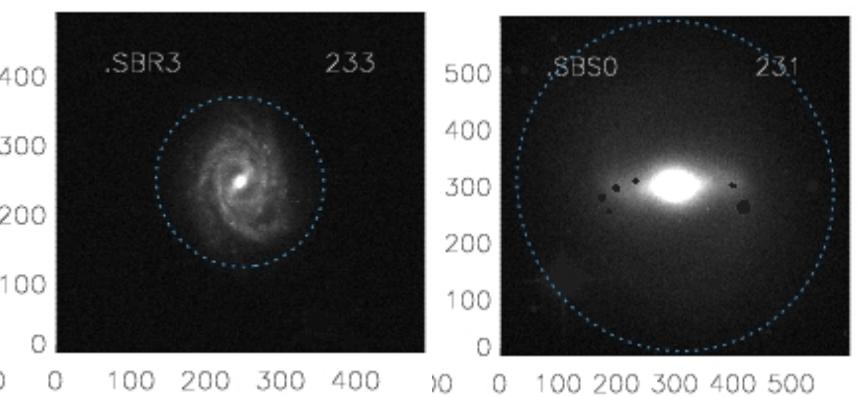

- Reduction

1. Subtract bias (1000DA)
2. Subtract sky background gradient
 - Koda's code in IDL + mask
 $R_{25} * 2$
3. Mask bright stars/adjacent galaxies in IDL (visual check)
4. Deproject @ R_{25} mag/arcsec² by ellipse fitting with IDL
5. Discard 191 highly inclined galaxies/ 84 galaxies with smaller frame than R_{25}
;; #866 spirals

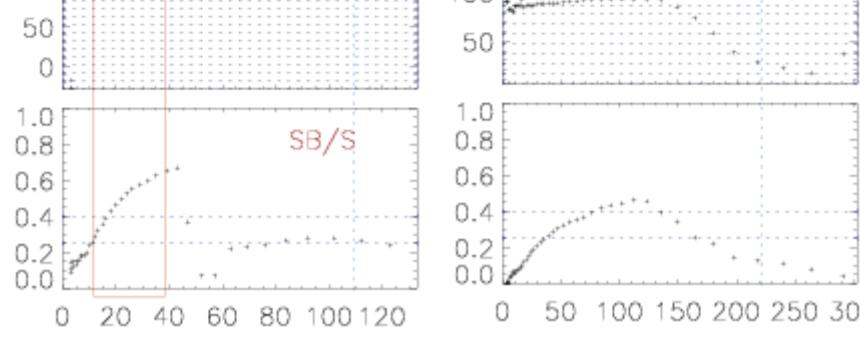

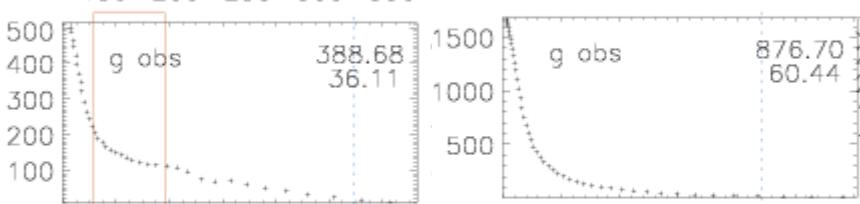

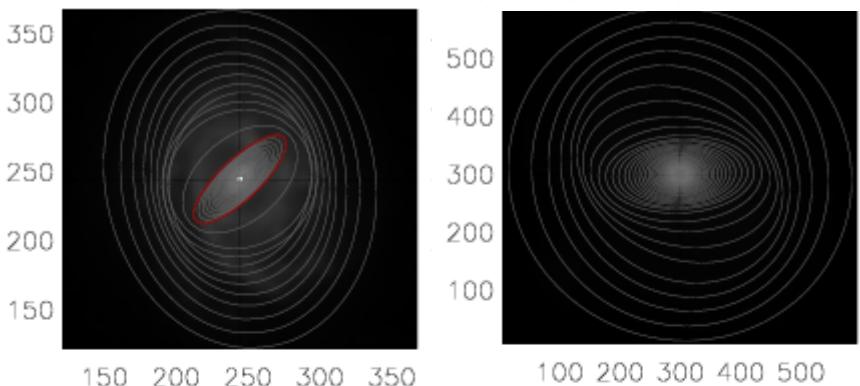

3. Bar Classification Methodology (1) Visual inspection

- UGC (Nilson 1973), RSA (sandage & Tamman 1987), RC3(de Vaucouleurs 1991)
- Nair & Abraham 2010; Oh et al. 210; Lee et al. 2011; Masters et al. 2010, 2011, 2012; Holye et al. 2011; Skibba et al. 2011, 2012; Simmons et al. 2014; Ann et al. 2015

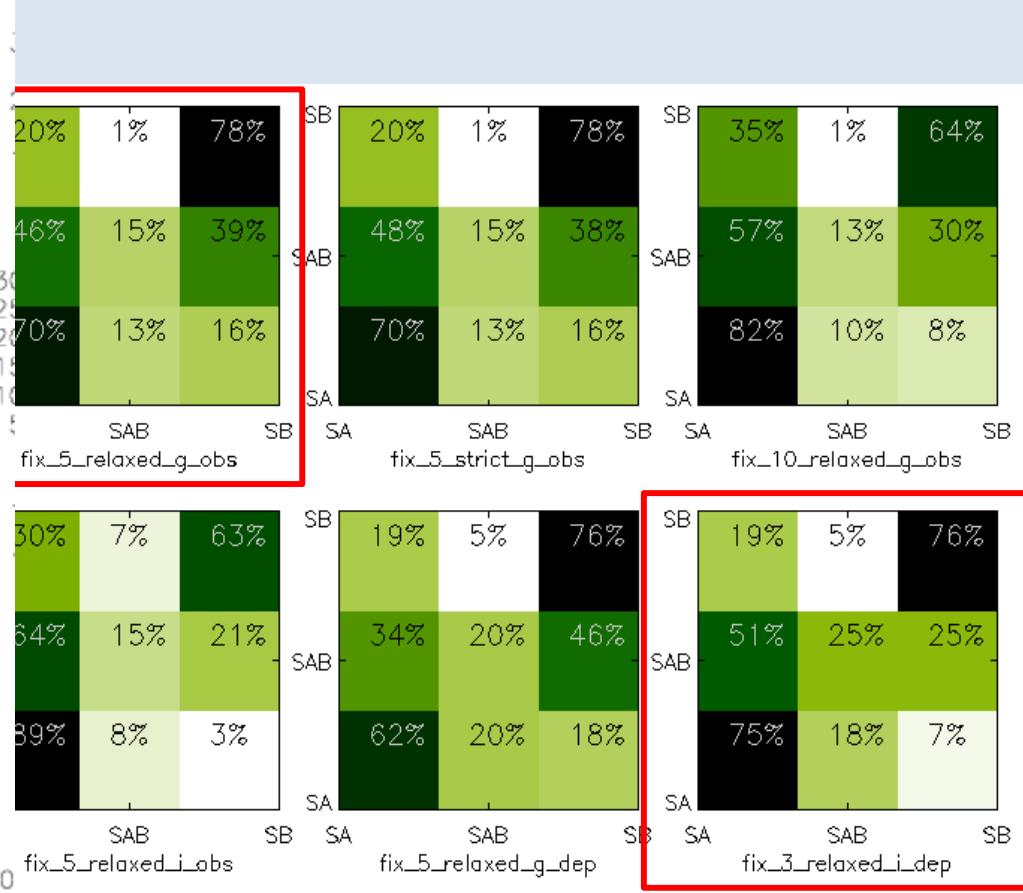

Methodology

vis et al. (1985) & Anthanssoula

3. Bar Classification Methodology (4) ellipticity augmented by bar strength

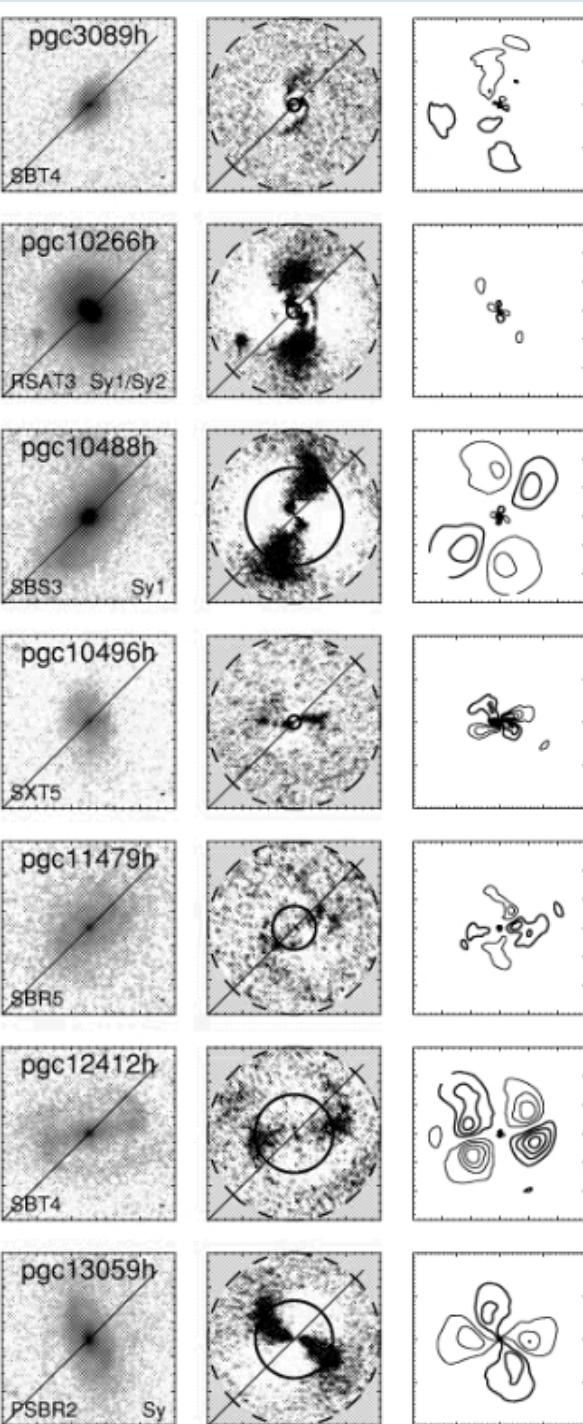

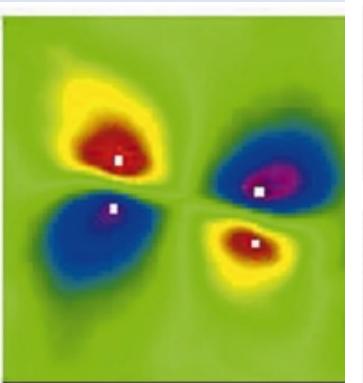

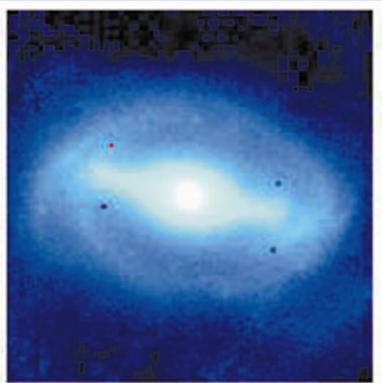

STEP1. Calculating bar strength

1. Deprojection of i band image
2. Calculation of potential by solving Poisson's equation using FFT (Hohl & Hockney 1969; Quillen 1993; Buta & Block 2001; Laurikainen & Salo 2004)

 - ✓ M/L ~ constant
 - ✓ $hr/hz=2.5$ in early spirals
 - ✓ $hr/hz=4.5$ in early spirals (Grijts 1998)
 - ✓ Exponential disk & non-exponential disk

3. Bar strength (Combes & Sanders 1981)

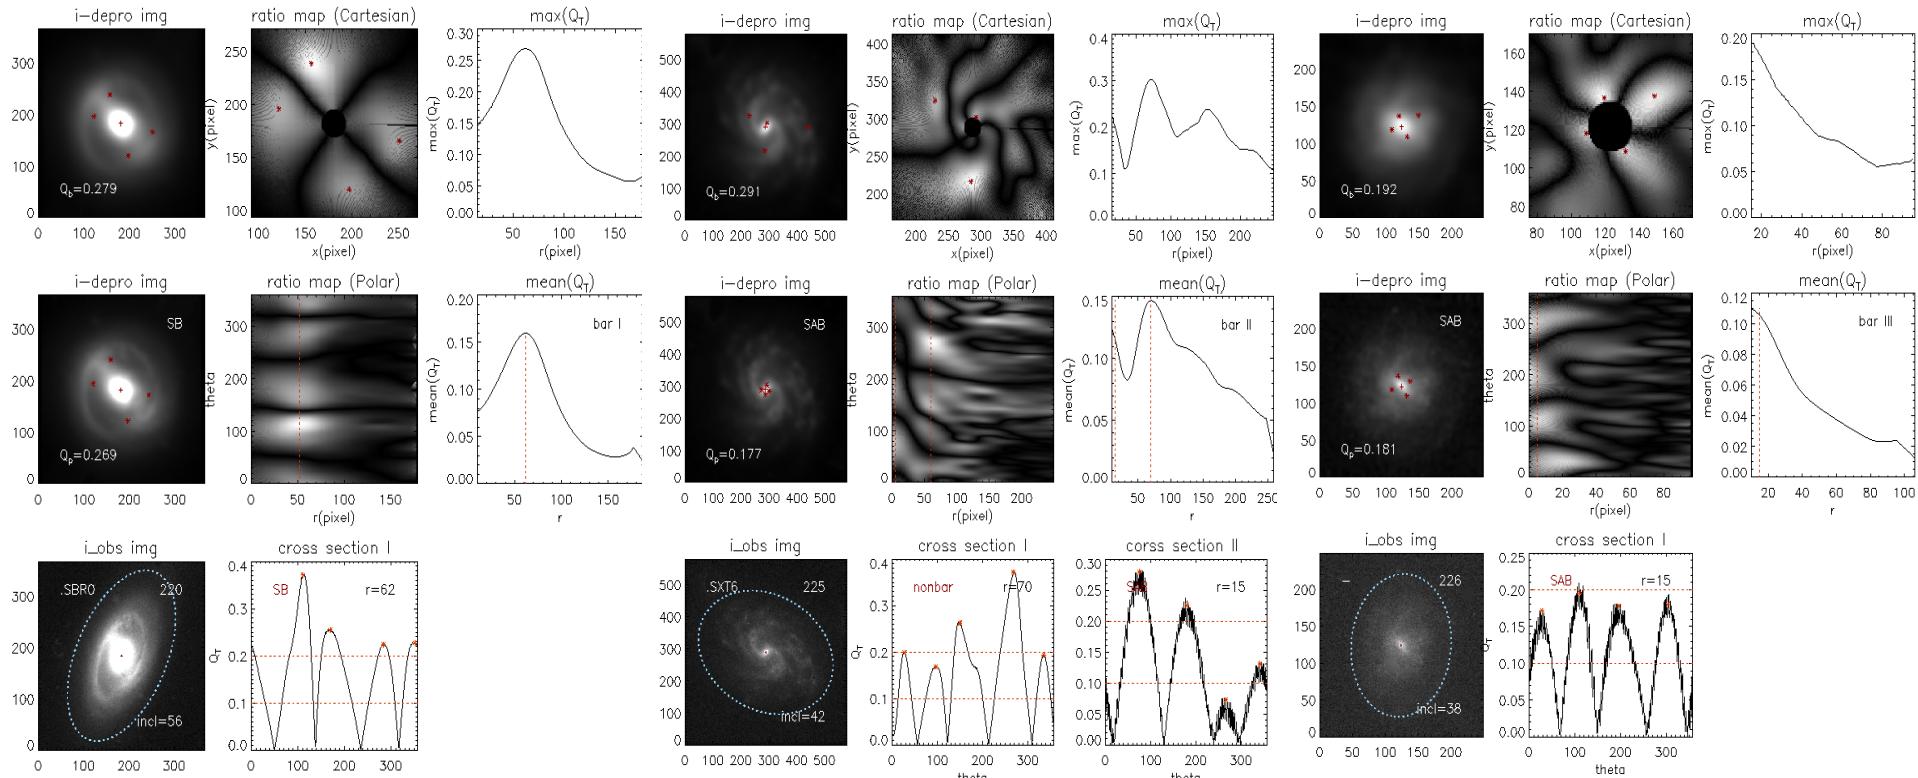

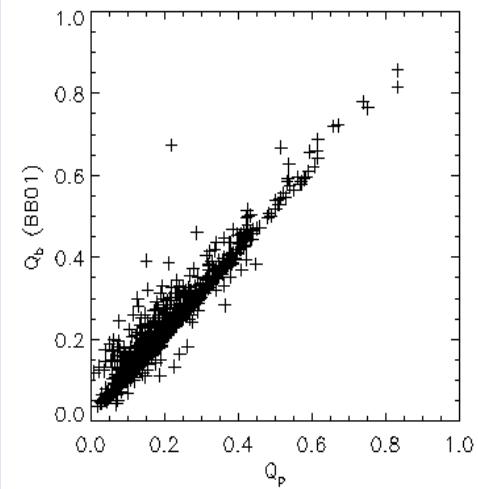

$$Q_T(R) = \frac{F_T^{\max}(R)}{\langle F_R(R) \rangle}$$

STEP2. bar Strength in polar coordinates

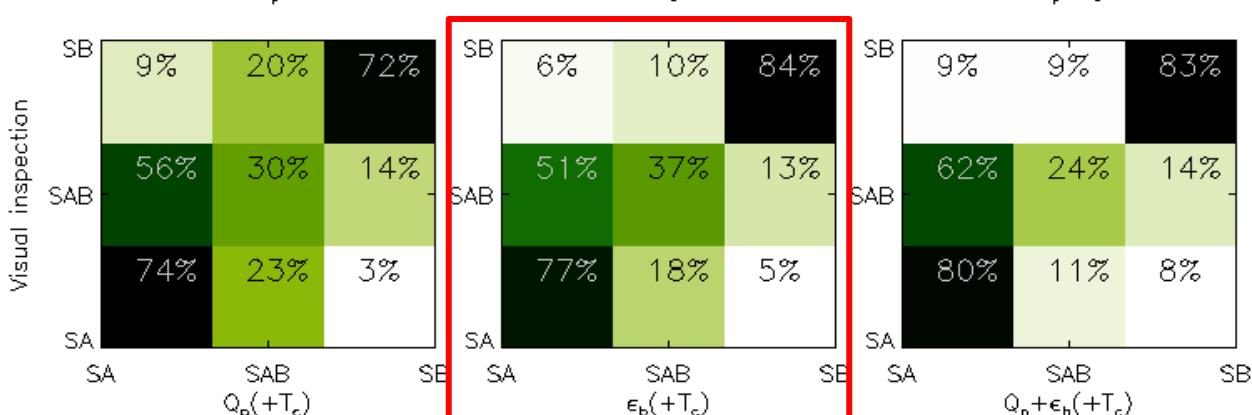

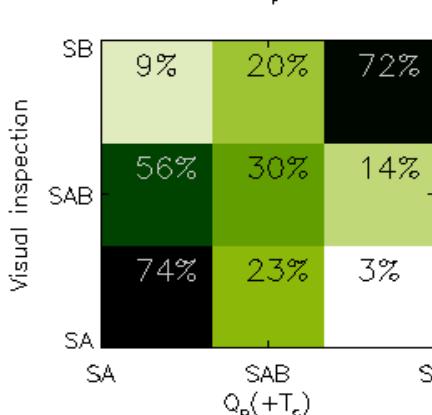

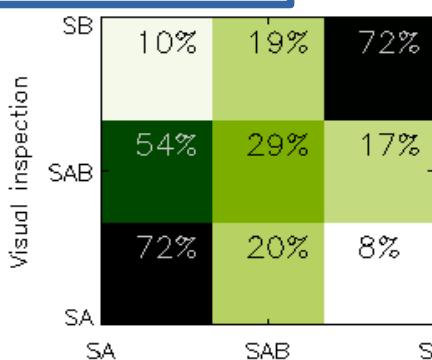

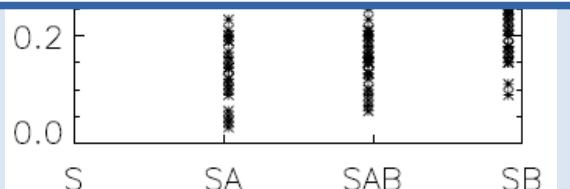

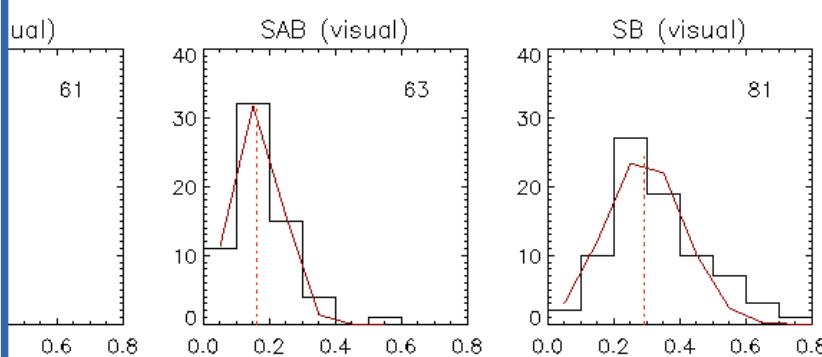

1. Bar strength in Polar coordinates
2. mean Q_t vs radius
3. $Q_p \equiv$ mean Q_t of 4 peaks @ $Q_{t\max}$ radius

1. Bar candidates: 4 peaks!! @ $Q_{t\max}$

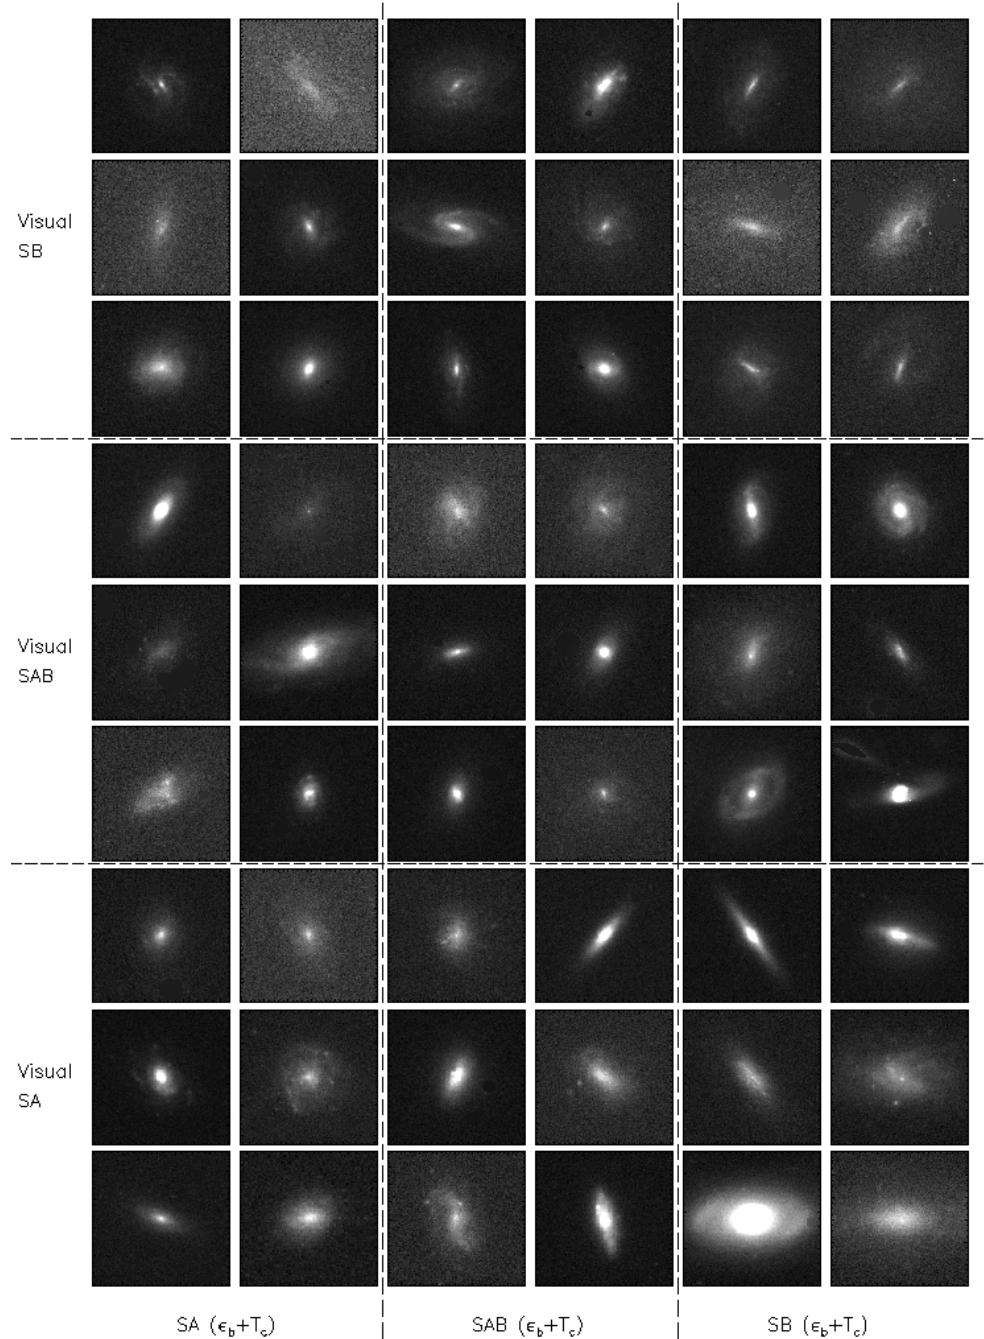

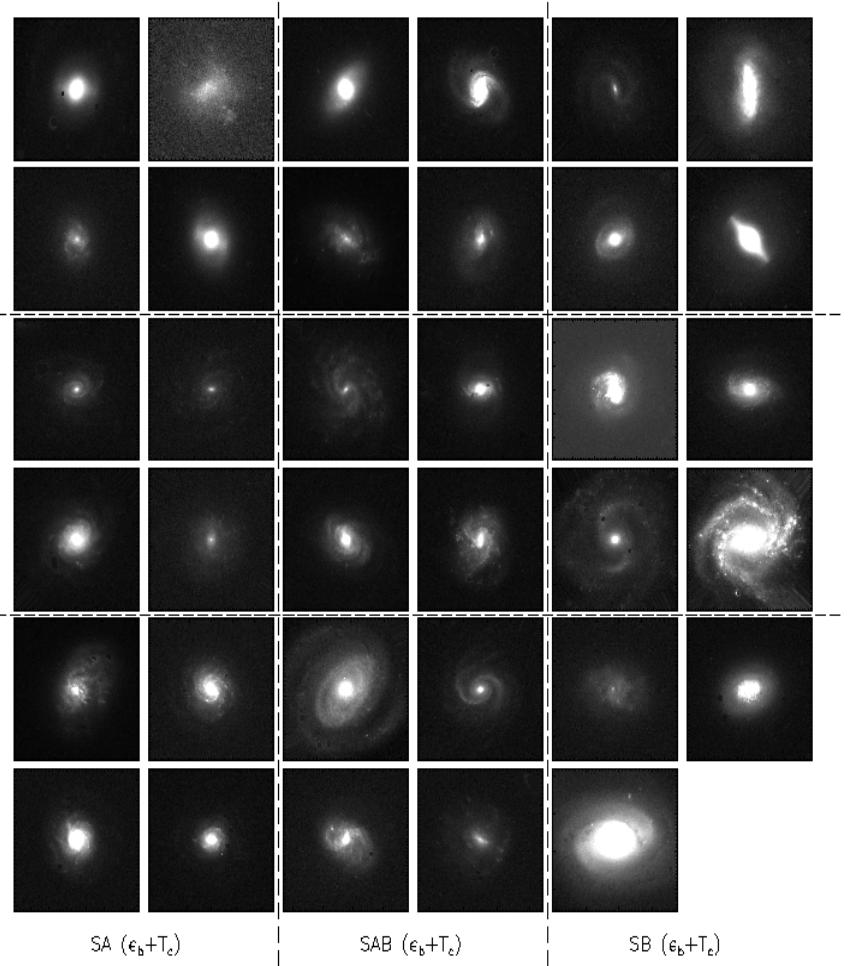

STEP3. Criterion for classification

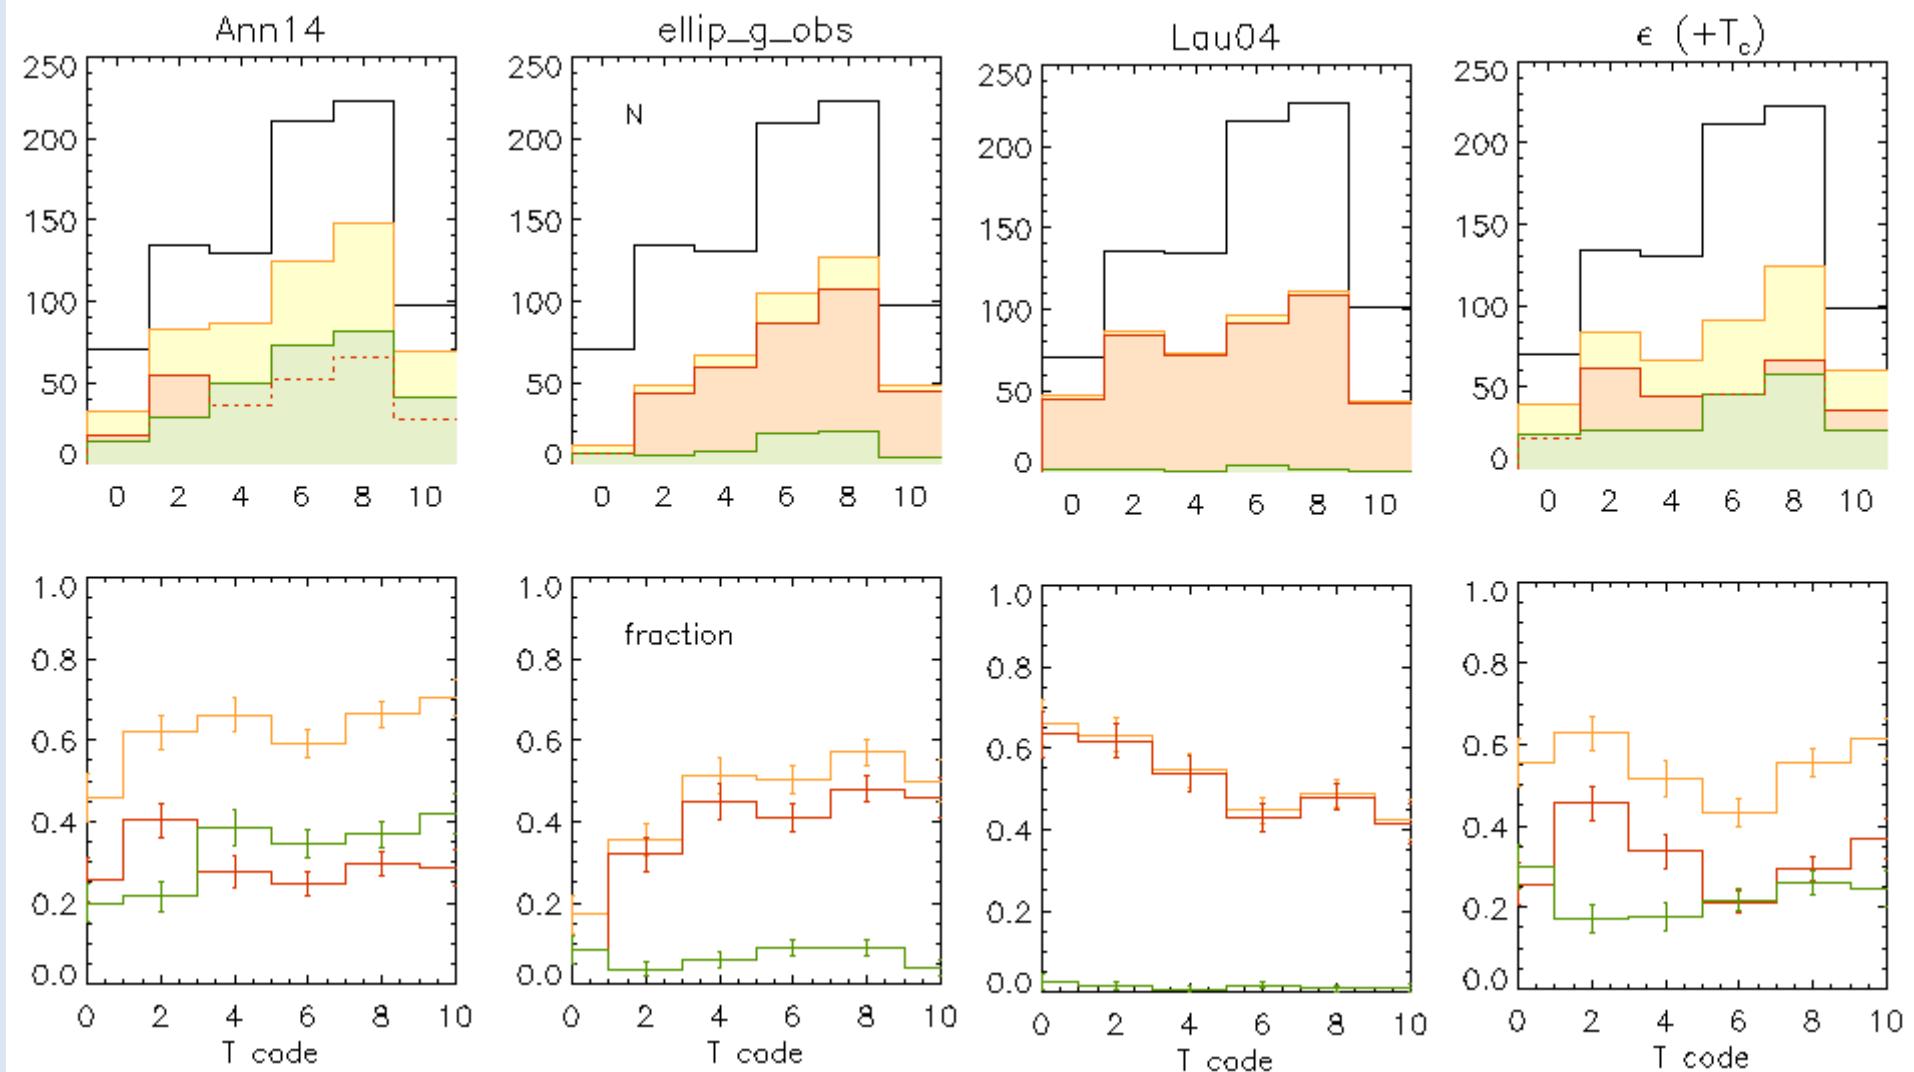

| parameter | group | SA | SAB | SB |
|--------------|---------------|-------------|--------------------|----------|
| Q_p | all spirals | ≤ 0.16 | $0.16 < \leq 0.24$ | $0.24 <$ |
| | early spirals | ≤ 0.13 | $0.13 < \leq 0.21$ | $0.21 <$ |
| | late spirals | ≤ 0.17 | $0.17 < \leq 0.26$ | $0.26 <$ |
| ϵ_b | all spirals | ≤ 0.36 | $0.36 < \leq 0.47$ | $0.47 <$ |
| | early spirals | ≤ 0.33 | $0.33 < \leq 0.43$ | $0.43 <$ |
| | late spirals | ≤ 0.37 | $0.37 < \leq 0.51$ | $0.51 <$ |

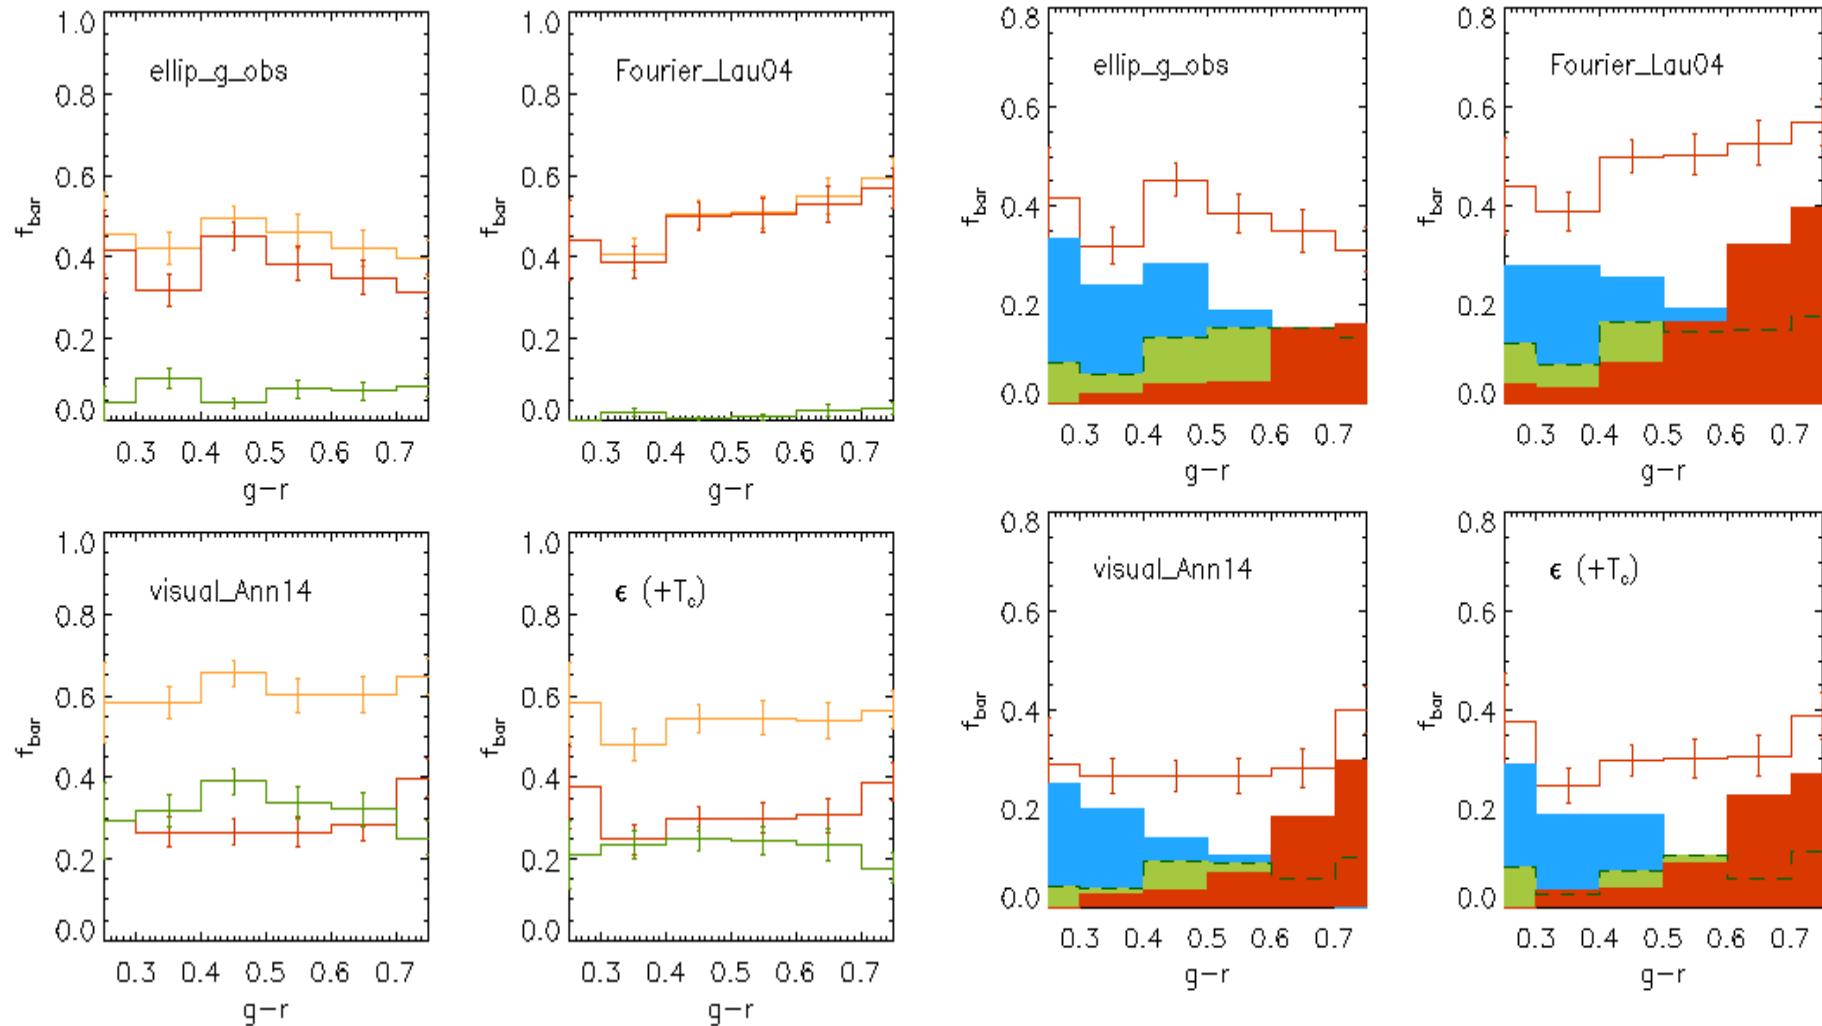

example galaxies

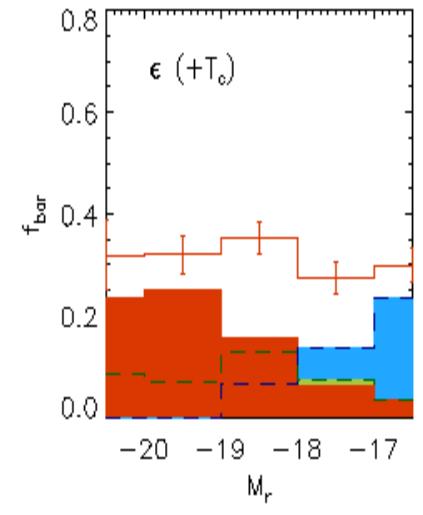

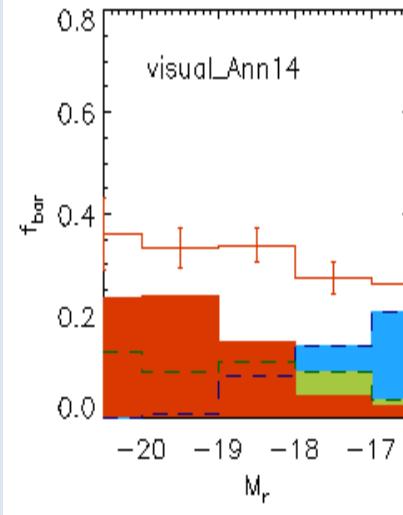

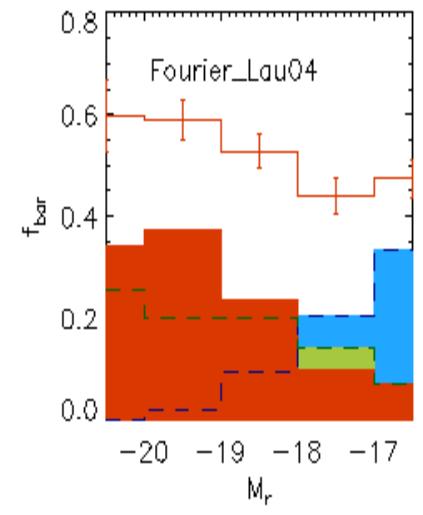

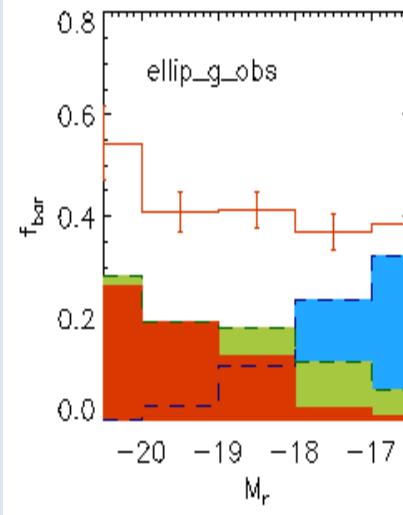

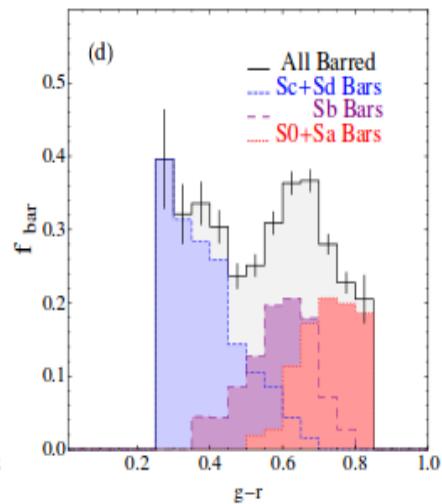

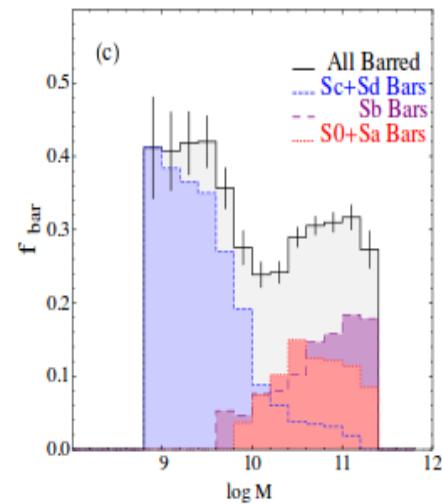

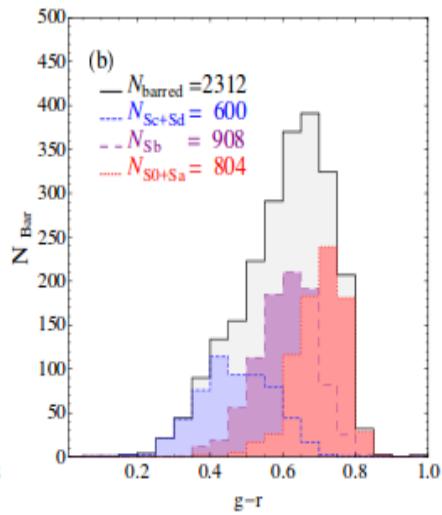

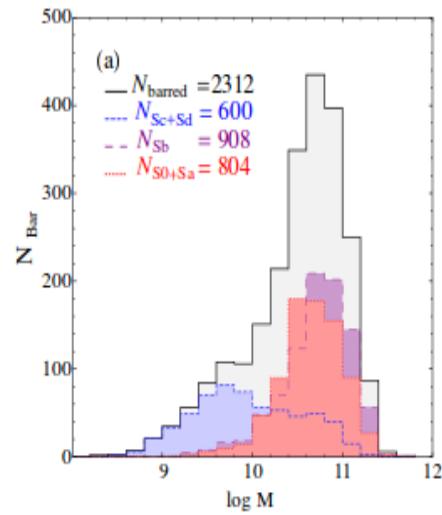

4. Hubble-dependent Bar Fraction

Color-dependent Bar Fraction

Luminosity/mass-dependent Bar Fraction

Summary

- We propose a new method to classify bar automatically using ellipticity augmented by bar strength ratio map.
- Large bulge in early spirals is the main source of confusion which makes the classification dependent on the methods.
- The controversial Hubble/color-dependent bar fractions have been induced from the systematic problems of different methods to classify bars.
- Strong bars are frequent in luminous/massive galaxies.
