# Motivation

$$BR(B \rightarrow e\nu)_{SM} \sim 10^{-11}$$

$$BR(B \rightarrow \mu\nu)_{SM} \sim 3.5 \times 10^{-7}$$

$$BR(B \rightarrow \tau\nu)_{SM} \sim 10^{-4}$$

$$BR(B^+ \rightarrow \ell^+ \nu_\ell) = \frac{G_F^2 m_B m_\ell^2}{8\pi} \left(1 - \frac{m_\ell^2}{m_B^2}\right)^2 f_B^2 |V_{ub}|^2 \tau_B$$

<The Feynmann diagram, SM branching fraction, order of B. F( $B \rightarrow \ell^+ \nu_\ell$ )>

(Loose Tagging)	Up-to-date results: $B \rightarrow \ell \nu$
$BR(B^+ \rightarrow e^+ \nu_e) < 9.8 \times 10^{-7}$	$253 fb^{-1}$
Belle Collab., PLB 647, 67 (2007).	
$BR(B^+ \rightarrow \mu^+ \nu_\mu) < 1.0 \times 10^{-6}$	$426 fb^{-1}$
BABAR Collab., PRD 79, 091101 (2009).	
(Hadronic Tagging)	
$BR(B^+ \rightarrow e^+ \nu_e) < 5.2 \times 10^{-6}$	
$BR(B^+ \rightarrow \mu^+ \nu_\mu) < 5.6 \times 10^{-6}$	$342 fb^{-1}$
BABAR Collab., PRD 77, 091104 (2008).	@ 90% C.L.

- A clean process for the measurement of  $f_B, |V_{ub}|^2$ , within the SM.
- Helicity suppression in the SM  $\rightarrow$  B. F.  $\propto m_\ell^2$
- Deviation from the SM may reveal New Physics ! (e.g. 2HDM(type2), lepto-quark)
- Evidences of  $B^+ \rightarrow \tau^+ \nu_\tau$  from Belle and BABAR experiments.

$$BR(B^+ \rightarrow \ell^+ \nu_\ell)_{2HDM} = BR(B^+ \rightarrow \ell^+ \nu_\ell)_{2HDM} \times \left(1 - \tan^2 \beta \frac{m_B^2}{m_H^2}\right)^2$$

W. Hou, Phys. Rev. D. 48, 2342 (1993).

Result presented today is on...

**An update using full  $\Upsilon(4S)$  data ( $772 \times 10^6 B\bar{B}$  events) / Hadronic tagging on  $\ell = e, \mu$ .**

# Hadronic Tagging

# B-factories

- Precise knowledge of the initial states in  $e^+e^-$  collisions.

- $Br(Y(4S) \rightarrow B\bar{B}) > 96\%$ ;  $w/ p_B^* = 380 \text{ MeV}/c$

# Hadronic Tagging

## Definition:

Complete reconstruction of a  $B$ -meson ( $B_{tag}$ ) in an  $Y(4S) \rightarrow B\bar{B}$  decay via hadronic decay channels.

- Obtain the momentum of the signal side  $B$  meson with no additional effort.
  - Especially important for decays with limited access in the signal side.
  - $B^+ \rightarrow X\tau^+\nu_\ell; B \rightarrow X\nu\bar{\nu} \dots$
- High resolution in kinematical variables with  $B_{tag}$  quality control.
- Good continuum suppression.

**Pros:** The best knowledge on kinematics in the  $B_{sig}$  results in high purity !

**Cons:** Low efficiency due to the prior reconstruction of the  $B_{tag}$ .

$$p(e^+) + p(e^-) = p(B) + p(\bar{B})$$

$$\text{Br}(Y(4S) \rightarrow B\bar{B}) > 96\%$$

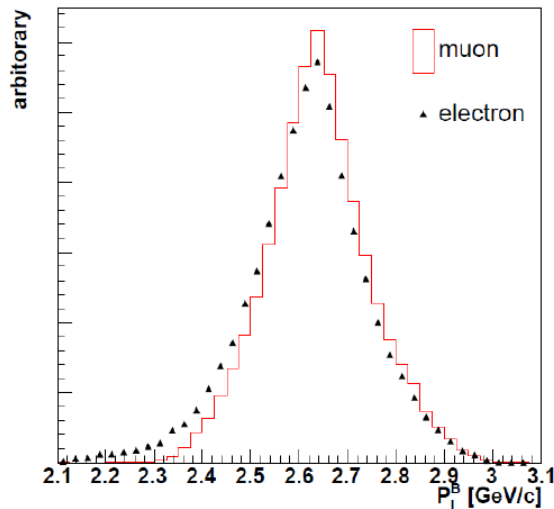

$$p_B^{CM} = 380\text{MeV}/c : \text{Spherical event shape}$$

# Hadronic Tagging in $B^+ \rightarrow \ell^+ \nu_\ell$

Excuse me for a little bit of spoiler !

<Untagged Reconstruction>

- The signal lepton candidate's momentum in  $B_{sig}$  rest frame. -

$$\epsilon_{sig} = 2.18\%$$

$$N_{bkg} = 7.4 \pm 1.0$$

Higher Efficiency

N. Satoyama (et al.) (Belle Collaboration),  
PLB 647, 67 (2007).

<Hadronic Tag. Reconstruction>

$$\epsilon_{sig} = 0.104\%$$

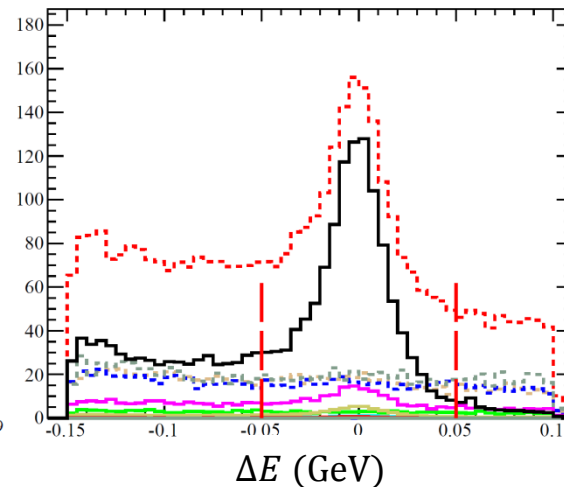

$$N_{bkg} = 0.26^{+0.10}_{-0.08}$$

An order better resolution.  
Zero-continuum BG analysis.

# In our analysis! : $B_{tag}$ quality

- 615  $B^+$  channels with hierarchical reconstruction procedure.
- $B_{tag}$  quality control via:

- $M_{bc} = \sqrt{(E_{beam}/2)^2 - |\vec{p}_{B_{tag}}|^2} > 5.27 \text{ GeV}/c$
- $\Delta E = E_{B_{tag}} - E_{beam}/2 : -0.05 \text{ GeV} < |\Delta E| < 0.05 \text{ GeV}$
- $O_{NB}$ : A neural network output.
  - More than one  $B_{tag}$  candidate in an event?  $\rightarrow$  The highest  $O_{NB}$  candidate chosen.
  - $-\log(O_{NB}) < 6$  for quality control.

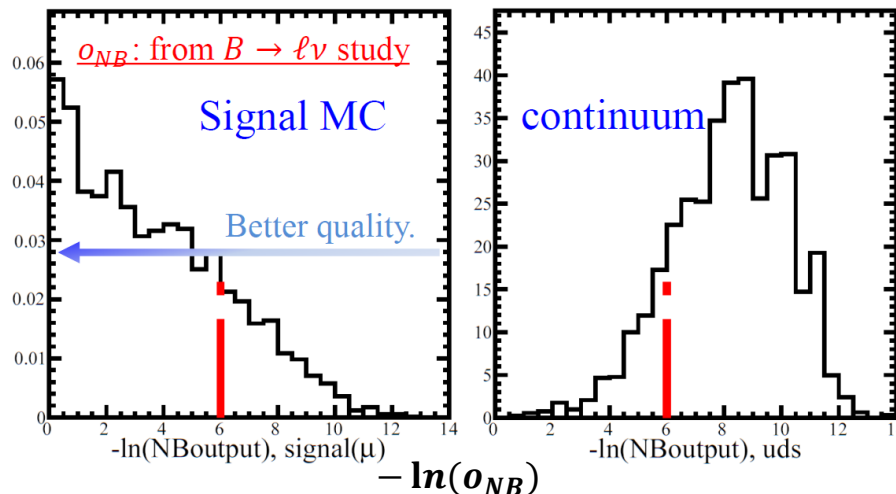

# In our analysis! : $B_{tag}$ quality

- 615  $B^+$  channels with hierarchical reconstruction procedure.
- $B_{tag}$  quality control via:

- $M_{bc} = \sqrt{(E_{beam}/2)^2 - |\vec{p}_{Btag}|^2} > 5.27 \text{ GeV}/c$
- $\Delta E = E_{Btag} - E_{beam}/2 : -0.05 \text{ GeV} < |\Delta E| < 0.05 \text{ GeV}$
- $o_{NB}$ : A neural network output.
  - More than one  $B_{tag}$  candidate in an event?  $\rightarrow$  The highest  $o_{NB}$  candidate chosen.
  - $-\ln(o_{NB}) < 6$  for quality control.

# In our analysis! : $\epsilon_{tag}$

- 615  $B^+$  channels with hierarchical reconstruction procedure.
- $B_{tag}$  quality control via:
  - $M_{bc} = \sqrt{(E_{beam}/2)^2 - |\vec{p}_{Btag}|^2} > 5.27\text{GeV}/c$
  - $\Delta E = E_{Btag} - E_{beam}/2 : -0.05\text{ GeV} < |\Delta E| < 0.05\text{ GeV}$
  - $o_{NB}$ : A neural network output.
    - More than one  $B_{tag}$  candidate in an event?  $\rightarrow$  The highest  $o_{NB}$  candidate chosen.
    - $-\log(o_{NB}) < 6$  for quality control.
- $\epsilon_{tag}$  ( $B$  tagging efficiency) calibrated to data event by event.
  - A control sample study using  $B \rightarrow D^{(*)} \ell \nu$  decays.
  - Calibrated in the  $o_{NB}$  value and the first hierarchy decay from the  $B_{tag}$ .
- $\epsilon_{tag} = 0.30$  (0.29)% for  $B \rightarrow \mu \nu$  ( $B \rightarrow e \nu$ ).

# Signal-side Event Selection

# Now let's turn our focus to

A high momentum lepton & an invisible neutrino.

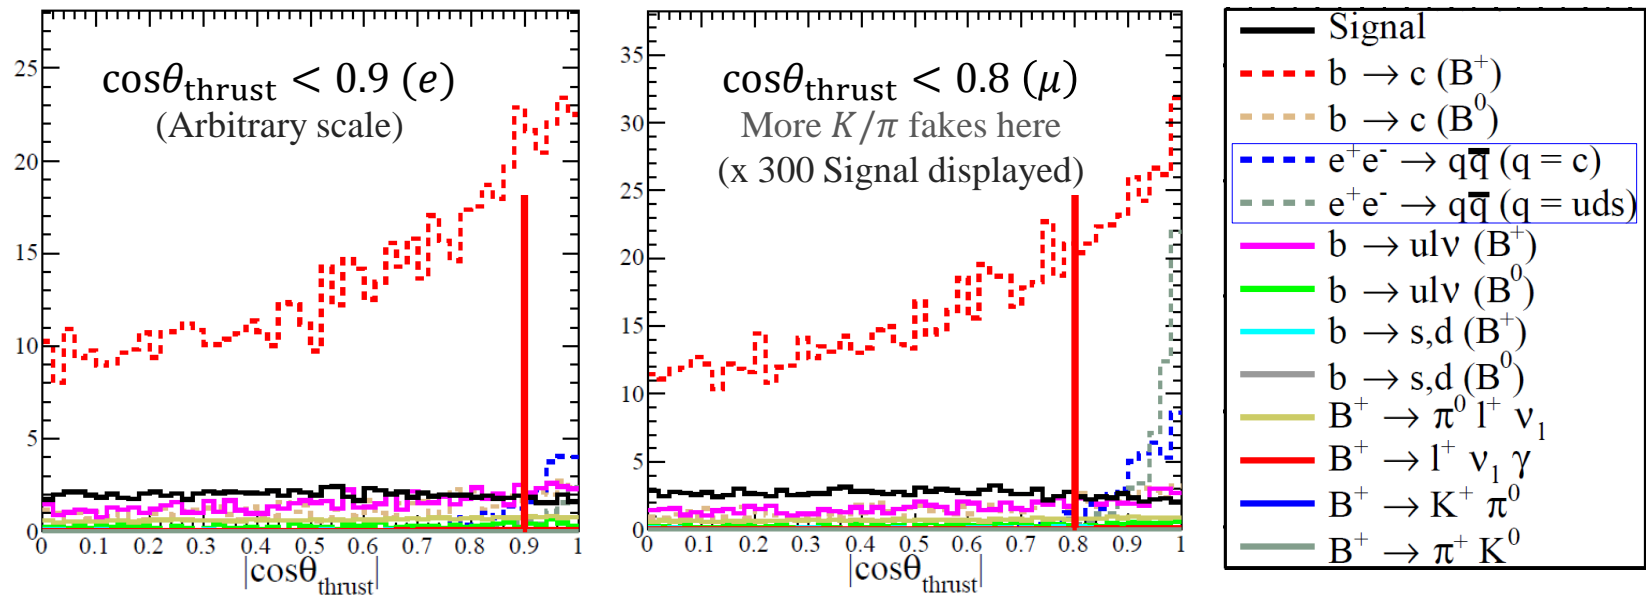

Pre-selection of events with a lepton with  $p_\ell^{LAB} > 1.8 \text{ GeV}/c$ .

Impact parameter conditions to sort good tracks.

( distance from the IP:  $dr < 0.05\text{cm}$ ,  $|dz| < 1.5\text{cm}$  )

# Continuum suppression

- Virtual extermination using  $\cos\theta_{thrust}$ .
  - $\theta_{thrust}$ :  $\angle (B_{tag} \text{ thrust axis}, \vec{p}_\ell^*)$

# Further BG suppression

- $E_{ECL} = E_{Total} - E_{Btag} - E_{\ell}$ 
  - No extra particles aside from the  $B_{tag}$  and the signal  $\ell$ .

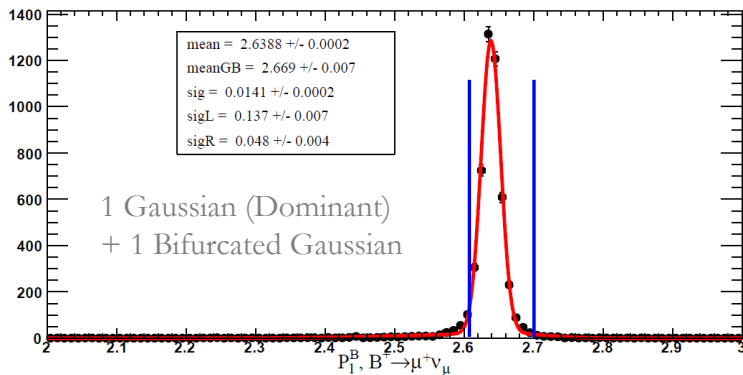

# Signal Extraction Variable

<Signal Enhanced plot of  $p_\ell^B$  for  $B \rightarrow \mu\nu$  search>

$p_\ell^B$ : The momentum of the signal  $\ell$  at the rest frame of the  $B_{sig}$ .

- Sharp-peaking near 2.64 GeV/c due to 2-body decay.
- **Very clean signal separation with low BG.**

## Signal region decision

- $-2.5\sigma$  of the main Gaussian component in the histogram fit  $< p_\ell^B < 2.7 \text{ GeV}/c$ .
  - $e$ :  $2.606 \text{ GeV}/c < p_\ell^B < 2.7 \text{ GeV}/c$
  - $\mu$ :  $2.604 \text{ GeV}/c < p_\ell^B < 2.7 \text{ GeV}/c$

# Signal Extraction Variable

<Signal Enhanced plot of  $p_\ell^B$  for  $B \rightarrow \mu\nu$  search>

$p_\ell^B$ : The momentum of the signal  $\ell$  at the rest frame of the  $B_{sig}$ .

- Sharp-peaking near 2.64 GeV/c due to 2-body decay.
- **Very clean signal separation with low BG.**

$$BR = \frac{Y_{data} - N_{bkg}^{MC}}{N_{B\bar{B}} \cdot \epsilon_{signal}}$$

$Y_{data}$ : Observed data yield in the signal region.

$N_{bkg}^{MC}$ : Expected backgrounds in the signal region.

$N_{B\bar{B}}$ : Initial # of  $B\bar{B}$ .

$\epsilon_{sig}$ : Signal selection efficiency

## Signal extraction strategy!

$Y_{data}$ : count the events in the  $p_\ell^B$  signal region.

$N_{bkg}^{MC}$ : extrapolate from the background PDF fit to the side band data. The PDF's are obtained from the mode-by-mode histogram template 1D unbinned maximum likelihood fit.

# Signal Extraction Variable

<Signal Enhanced plot of  $p_{\ell}^B$  for  $B \rightarrow \mu\nu$  search>

$N_{bkg}^{BG}$

Estimation of backgrounds crucial in this study!

Peaking / heavily influential decays in the signal region treated with dedicated large MC samples.

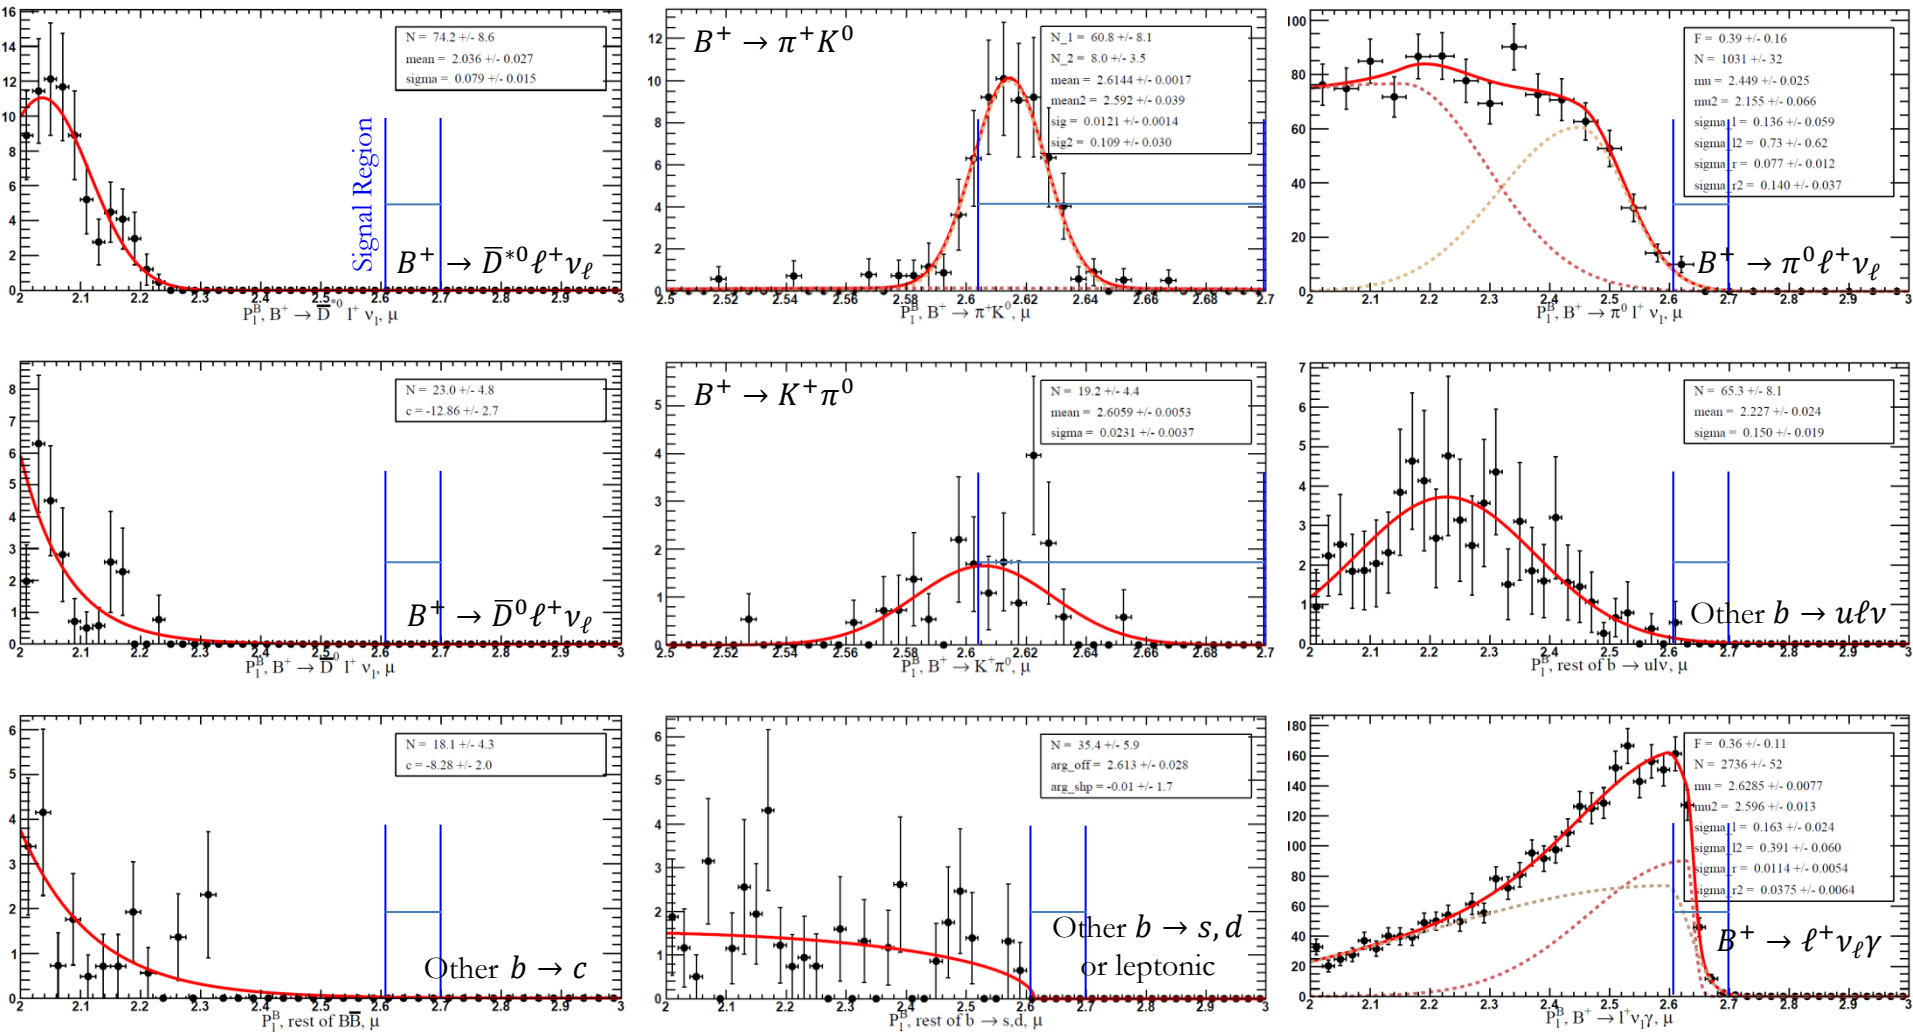

$b \rightarrow c$  decays, dominant in the low momentum range, composed of over 90% of  $B^- \rightarrow D^{(*)0} \ell^- \bar{\nu}$ .

## Expected from the MC histograms (Events)

	Backgrounds: $B \rightarrow \mu\nu$	Backgrounds: $B \rightarrow e\nu$
$b \rightarrow u\ell\nu$	0.0087 (13.8%)	0.0289 (13.0%)
Other $X_u\ell\nu$	0	0.0598 (26.9%)
$B^+ \rightarrow \pi^+ K^0$	0.0410 (65.1%)	0.0612 (27.6%)
$B^+ \rightarrow K^+ \pi^0$	0.0133 (21.1%)	0.0631 (28.4%)
$B^+ \rightarrow \ell^+ \nu_{\ell} \gamma$	0	0.0091 (4.1%)
<b>Total</b>	<b>0.063</b>	<b>0.222</b>

$B \rightarrow \ell\nu\gamma$  according to G. Korchemsky, D. Pirjol, and T.-M. Yan, PRD 61, 114510 (2000) Assumed  $BR(B \rightarrow \ell\nu\gamma) = 5.0 \times 10^{-6}$

# Background PDFs from histogram template fits

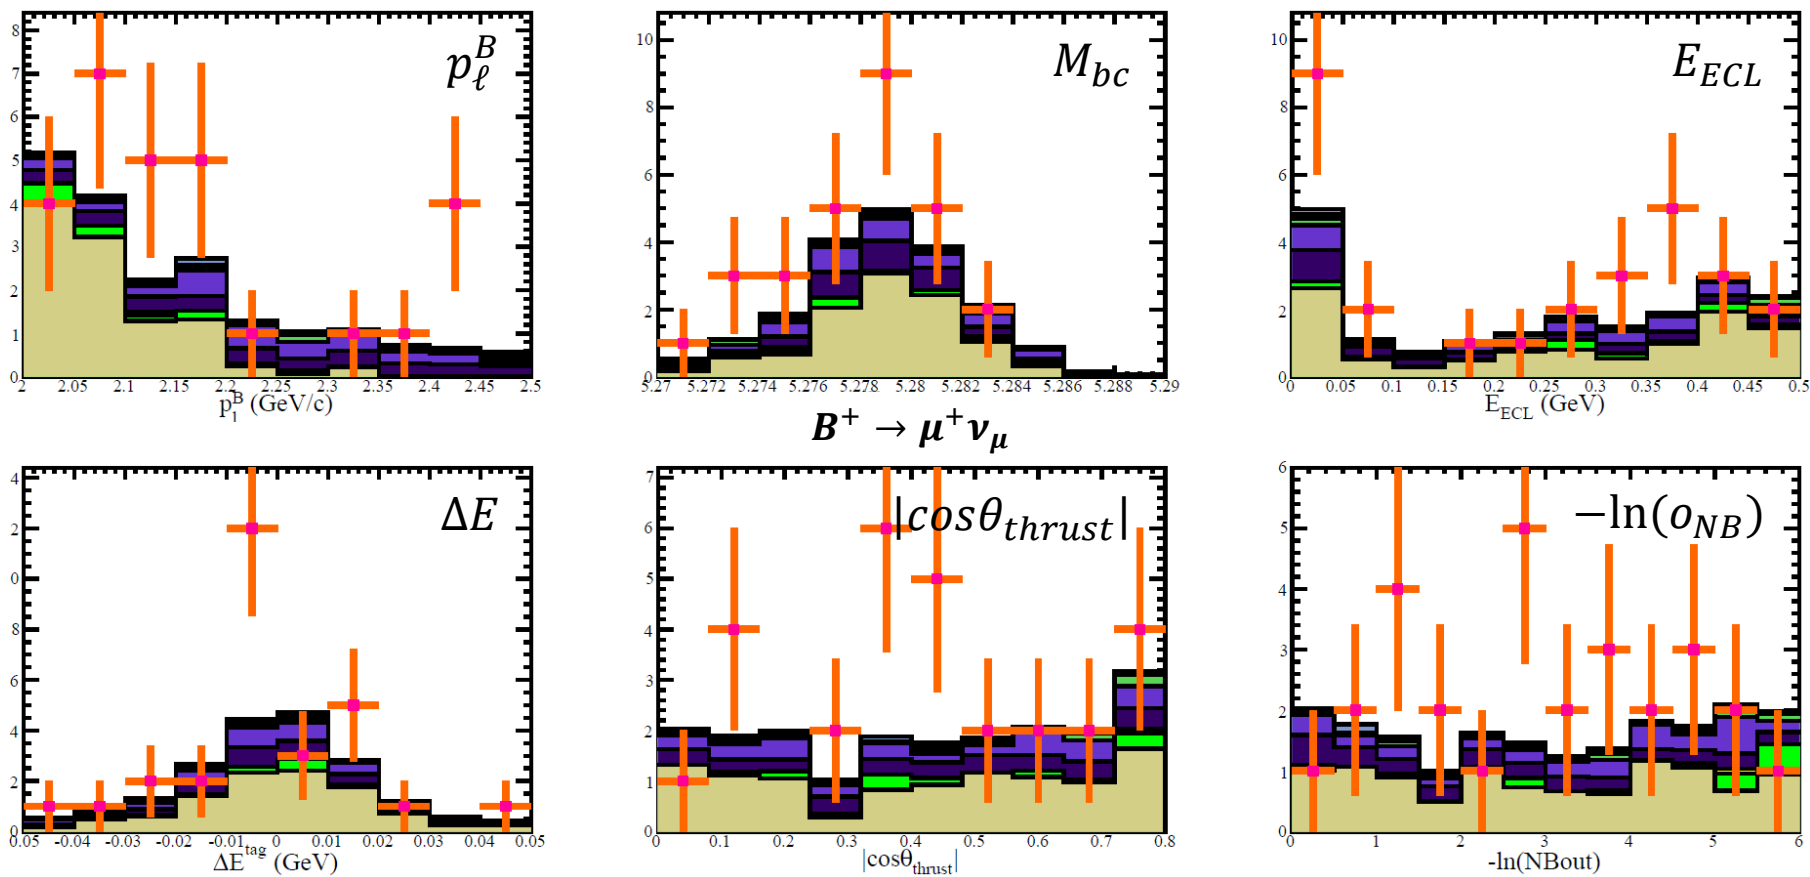

- $B^+ \rightarrow \mu^+ \nu_\mu$  mode
- Backgrounds PDFs summed w/ branching ratio weighting

# Verification

# MC compared w/ data in the $p_\ell^B$ sideband region

- $p_\ell^B$  sideband region  $\equiv 2.0 - 2.5$  GeV/c, all other criteria applied.

—+— Data (Y4S)

—  $b \rightarrow c (B^+)$

—  $b \rightarrow c (B^0)$

—  $e^+e^- \rightarrow q\bar{q} (q = c)$

—  $e^+e^- \rightarrow q\bar{q} (q = uds)$

—  $B^+ \rightarrow \pi^0 \Gamma^+ \nu_\Gamma$

—  $b \rightarrow ul\nu (B^+)$

—  $b \rightarrow ul\nu (B^0)$

—  $B^+ \rightarrow \Gamma^+ \nu_\Gamma \gamma$

—  $B^+ \rightarrow \pi^+ K^0$

—  $b \rightarrow s,d (B^+)$

$$\Sigma \chi^2/n.d.f. = 0.92$$

# $p_\ell^B$ shape calibration

- A control sample study using:
  - $B^+ \rightarrow \bar{D}^0 \pi^+$  :  $D^0 \rightarrow K^- \pi^+$  &  $D^0 \rightarrow K^- (3\pi)^+$ .
  - Treat  $\pi^+$  (primary pion) as  $\ell^+$ ,  $D^0$  as  $\nu_\ell$ .
  - Same conditions given for  $B^+ \rightarrow \ell^+ \nu_\ell$  analysis given.

Fitted each distribution and integrated each region.

$$C_{shape} \equiv \frac{N_{sig}(\text{Data} - \text{Bkg}) / N_{all}(\text{Data} - \text{Bkg})}{N_{sig}(\text{signal MC}) / N_{all}(\text{signal MC})}$$

$$= 0.954^{+0.033}_{-0.031}$$

Obtained BR within  $0.2\sigma$  deviation compared to the PDG world average.

(Including systematic uncertainties from  $K\pi$ -ID /  $C_{shape}$  / tag / PDF parameters / tracking uncertainties.)

# Signal Extraction & Branching Ratio

# Systematic Uncertainties

$$BR = \frac{Y_{data} - N_{bkg}^{MC}}{N_{B\bar{B}} \cdot \epsilon_{signal}}$$

- PDF uncertainty in parameters from the fit.
- Branching Ratio uncertainty.
- Statistical uncertainty of the experimental data in the sideband region.

$$N_{bkg}^{MC}(e) = 0.11_{-0.06}^{+0.08} \text{ events}$$

$$N_{bkg}^{MC}(\mu) = 0.33_{-0.08}^{+0.10} \text{ events}$$

Sources	Uncertainty
$N_{B\bar{B}}$	1.4 %
$\epsilon_{tag}$ correction	4.2 %
Lepton Identification	2.1 %
Tracking	0.35 %
MC statistics	2.0 %
$p_\ell^B$ shape	15.2 %
Sum	16.0 %

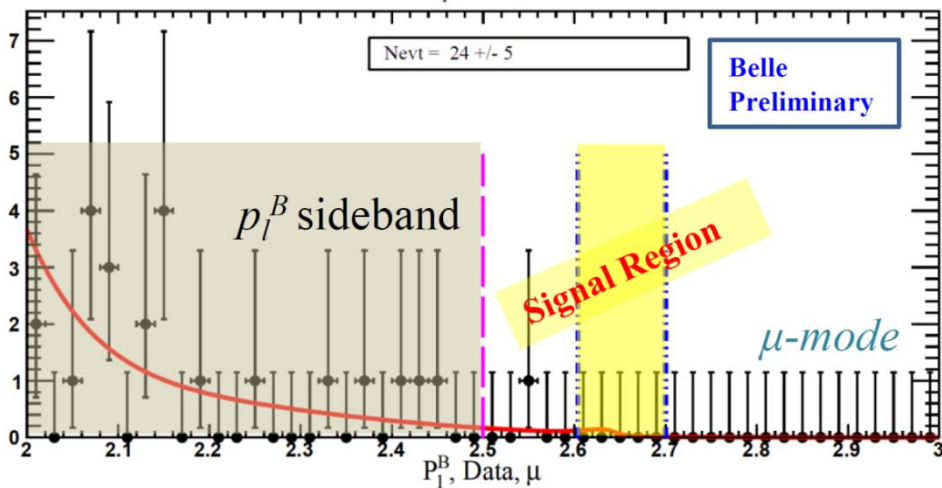

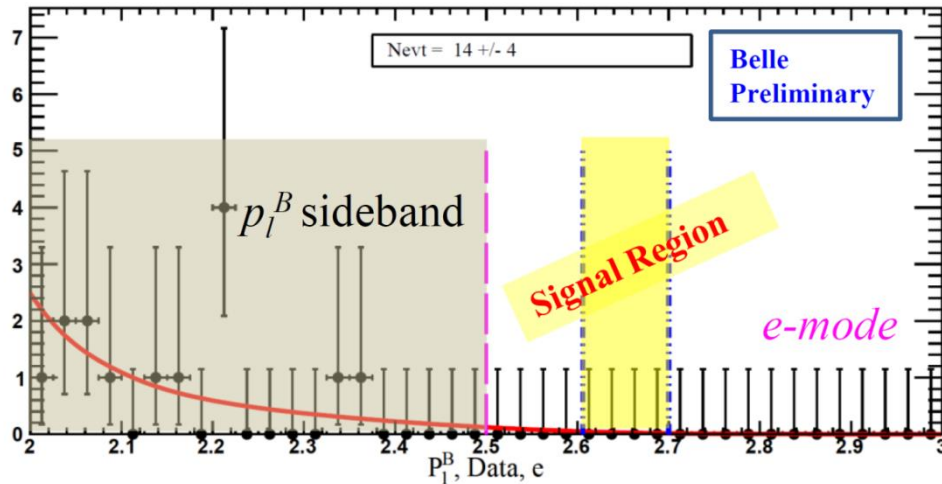

$$\epsilon_{signal}(e) = 0.091\%$$

$$\epsilon_{signal}(\mu) = 0.115\%$$

*A note on the  $p_\ell^B$  shape!*

The number here is based on the preliminary result. The study in p.21 was a modification after the preliminary result was presented, and the updated number will be presented in the paper soon to be submitted. In the updated the systematic uncertainty is reduced at  $\sim 6\%$ , along with slightly modified  $\epsilon_{signal}$  and  $N_{bkg}^{MC}$ . Very sorry about that!

# Opening the $p_\ell^B$ signal region

We observe no experimental data events in the  $p_\ell^B$  signal region.

	$B^+ \rightarrow \mu^+ \nu_\mu$	$B^+ \rightarrow e^+ \nu_e$
$Y_{data}$	0	0
$\epsilon_{signal}$	0.115% (16% unc.)	0.091% (16% unc.)
$N_{bkg}^{MC}$	$0.33^{+0.10}_{-0.08}$	$0.11^{+0.08}_{-0.06}$
<hr/>		
$BR(B^+ \rightarrow \mu^+ \nu_\mu) < 2.5 \times 10^{-6}$ (90% C.L.)		
$BR(B^+ \rightarrow e^+ \nu_e) < 3.5 \times 10^{-6}$ (90% C.L.)		

Upper limits calculated based on a frequentist approach,  
Feldman & Cousins method.

(G. J. Feldman and R. D. Cousins, PRD 57, 3878 (1998).)

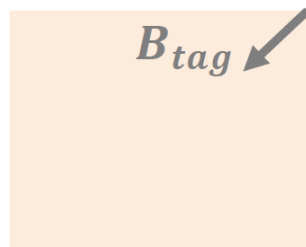

# Summary

- With 772M  $B\bar{B}$  events and hadronic tagging method, we search for the purely leptonic rare  $B$  meson decays,  $B^+ \rightarrow e^+ \nu_e$  and  $B^+ \rightarrow \mu^+ \nu_\mu$ .
- We obtain the most stringent “hadronic tagging method using” constraint, improved by a factor of two.
- The low background study demonstrated shows a promise of hadronic tagging method as a powerful probe for testing the SM and searching for the New Physics.
- The paper draft to be submitted soon with the final results.

# BACK UP

# Untagged study vs. Hadronic Tag.

- The two extremes of reconstruction.
  - A simple depiction with  $B^+ \rightarrow \ell^+ \nu_\ell$  search.

<Untagged Reconstruction>

<Hadronic Tag. Reconstruction>

**Pros:** Higher efficiency due to prior reconstruction.

**Cons:** Many combinatorial backgrounds and worse  $B_{tag}$  tagged variable resolution.

**Pros:** The best knowledge on kinematics in  $B_{sig}$  results in high purity.

**Cons:** Lower efficiency due to prior reconstruction.

# Variables used in the NN training

- Only including the variables for the higher hierarchy reconstruction due to the page-shortage reason.

Name	Variable
sumChildNB	Sum of the NeuroBayes outputs of all of the children
prodChildNB	Product of the NeuroBayes outputs of all of the children
ptot	$ p $
ChN_ptot	$ p $ of child N
ChN_NBout	NeuroBayes output of child N
ChN_PseudoHelAng	Angle between the child momentum in the mother's rest frame and the mother's direction in the $\Upsilon(4S)$ rest frame. For $D$ means, this really is a good approximation of the helicity angle.
ChN_hash	Decay hash of child N
ChN_Mass	Mass of child N
ChMN_Angle	Angle between children N and M in the CMS
ChMN_InvMassScaled	Invariant mass of children N and M, scaled to the maximum (=1) and minimum (=0) possible theoretical value.
mom_dir_dev	Angle between the momentum of the $D$ meson and the line connecting the IP and the fitted $D$ vertex.
dist_to_IP	Distance of the fitted $D$ vertex and the IP
sig_dist_to_IP	Significance of the distance of the fitted $D$ vertex and the IP
deltaE	$\Delta E$
Dstar_D_massdiff	$M(D^*) - M(D)$
D_hash_from_1st_dstar	Decay hash from the first $D^*$ meson
D_hash_from_2nd_dstar	Decay hash from the second $D^*$ meson
CosThetaB	$\cos \theta_B$
ChN.D.dist	Distance of closest approach of a track from the B decay to the fitted vertex of the $D$ meson

TABLE XXIII. Variables used in the stage 2, 3 and 4 trainings

# $\epsilon_{tag}$ calibration

$$x \equiv \ln NB_{out}$$

$$F^{DATA}(x)/F^{MC}(x) \equiv C(x)$$

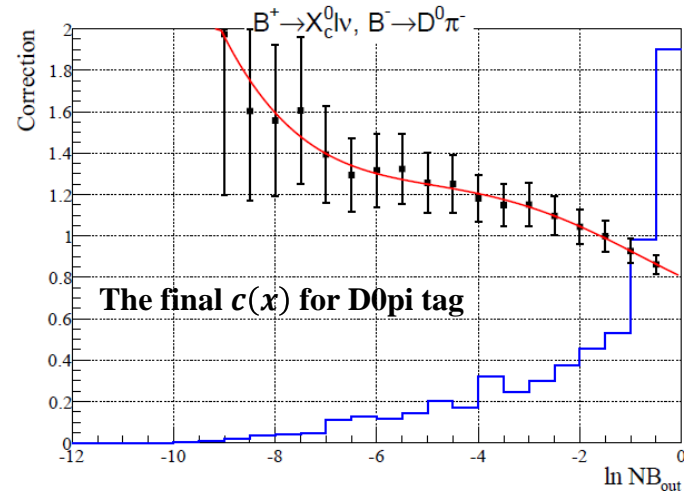

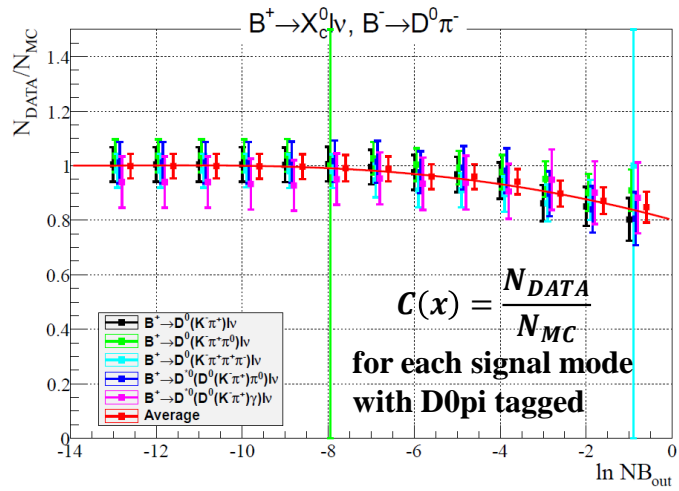

$$F(x) = \int_x^0 f(z) dz$$

(distribution of  $\ln(NB_{out})$ )  
 (# event in within  $\ln(NB_{out})$  cut.)

$$c(x) = \frac{f^{DATA}(x)}{f^{MC}(x)} = C(x) - \frac{F^{MC}(x)}{f^{MC}(x)} \frac{dC(x)}{dx}$$

The correlation factor can be expressed as a function of  $NB_{out}$ . This is done for each tagged decay structure.

<with these definitions>

overall MM2 distribution of the specified signal

# $O_{NB}$ in terms of Efficiency and Purity

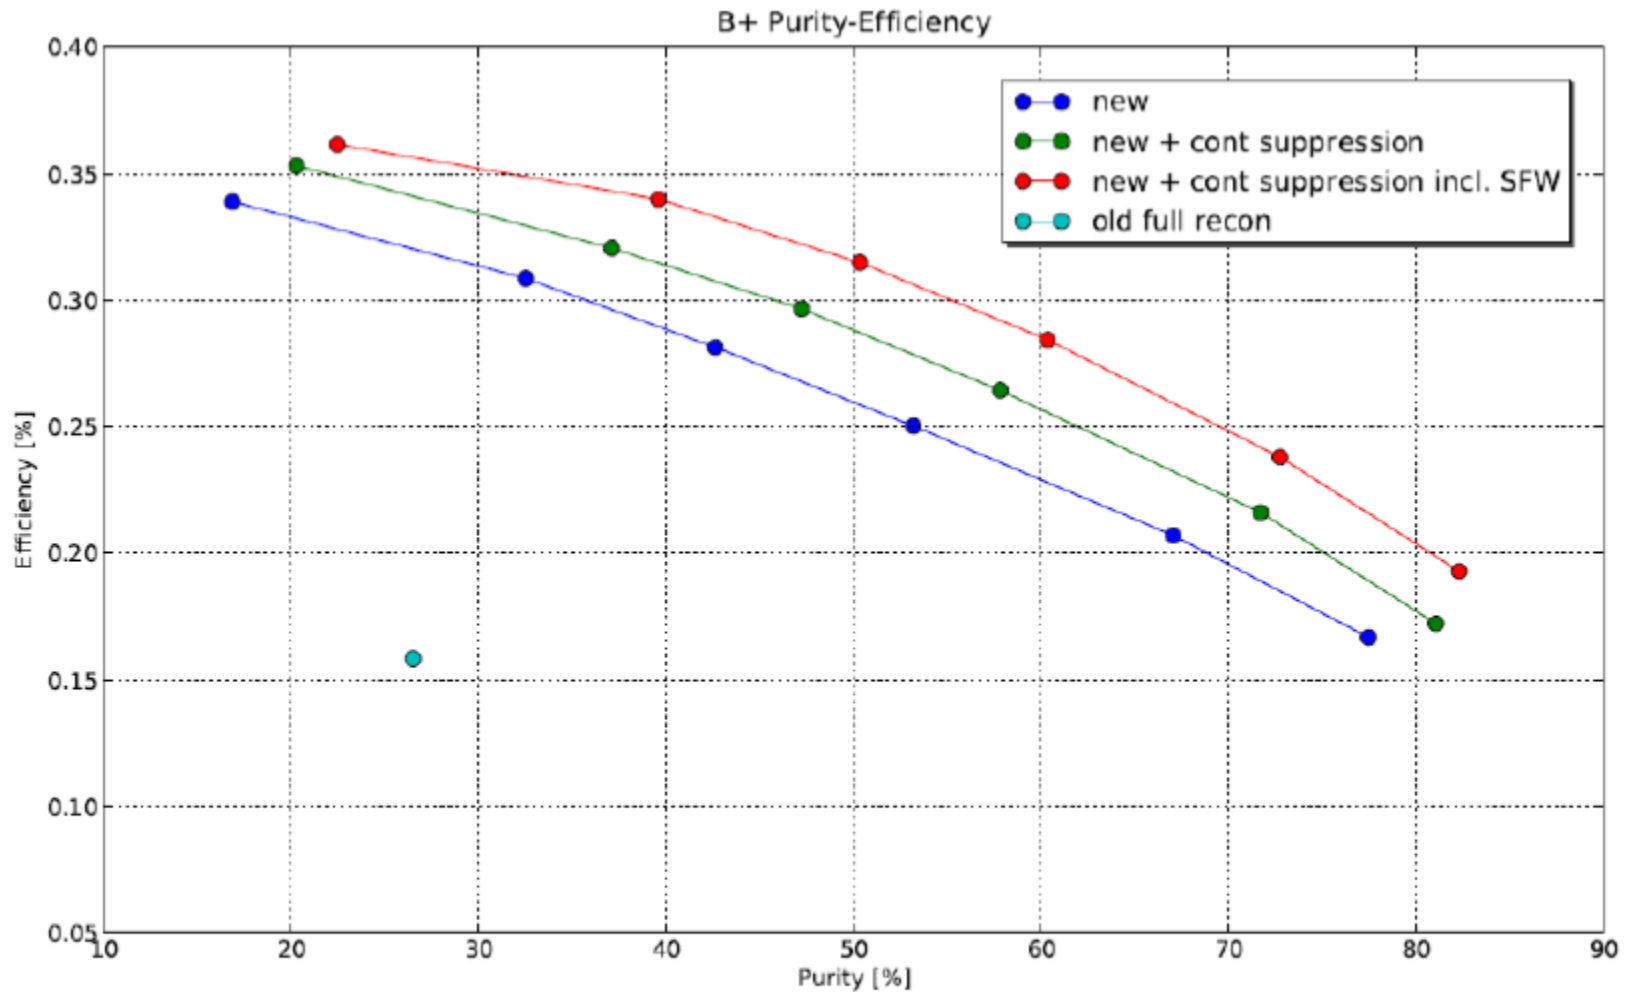

FIG. 19. Purity-efficiency plot for  $B^+$  mesons

# $N_{bkg}^{MC}$

- Calculated as

$$BG_{est} = N_{sideband(Data\ fitted)} \times \frac{S(MC)_{signal}}{S(MC)_{sideband}}$$

where S/S stands for the rate of events in the signal region to the events in the sideband region.

# $N_{bkg}^{MC}$ presented in this talk

- Based on less categorization of BG.
- The uncertainty calculation.
  - Varied the fit parameters by  $1\sigma$  and summed the effects.
  - The amount of PDG value varied for the well measured modes.
  - Conservative PDG uncertainty assumption for the rest. (+200% -50%, +/- 50% for lnugamma BG).

# The uncertainty in S/S of $N_{bkg}^{MC}$

PDF error	PDF	parameter	$S(MC)_{signal}/S(MC)_{sideband}$
$B\bar{B}$	Exponential	slope	$0.0090^{+0.00048}_{-0.00017}$
		normalization	$0.0090^{+0.00093}_{-0.00076}$
